Machine Translated by Google

The Suunto 9 Peak Pro received its last update in January 2026.

1. Released in October 2022
2. We've added dozens of features since its 2022 launch
3. Its last update was released in January 2026
4. From now on, the device will no longer receive updates from software because the internal memory is full. The only exception
   It is the correction of any critical or important problem that may arise.
5. It's not the end of new features; you'll continue to receive new watch faces and new apps for Suunto Plus.

Machine Translated by Google

Vertical 1 – Working to optimize it

- We haven't forgotten about Vertical.

Although no new updates have been confirmed at the moment , we are working to prepare it for future updates. We will share more details once this work is finished. We appreciate your understanding and continued support.

Machine Translated by Google

Q1-2026 Release Notes

Race S, Race, Race 2,Vertical 2

POINT 1

• Smart Navigation

– Smart OFF ROUTE

(smart off-route alerts based on speed, direction and distance)

– Off-route guidance (distance

and direction to the nearest point on the route)

– Track Back

(automatic route creation using breadcrumbs)

– Smart Autozoom Turns

(dynamic zoom when approaching a turn based on distance, direction and speed)– Ability

to select the zoom type in Climb Guidance: by distance, segment, or waypoint

– Intelligent management of consecutive turns (the next

turn is not shown until the current one is completed if they are <20 m apart)

– Customizable data field on the map and Climb Guidance (up to 5 configurable data

points: HR, power, distance, etc.)

– Enable/disable ascent and descent notifications in Climb Guidance

– Activate/deactivate turn-by-turn navigation

– Activate / deactivate Smart Autozoom Turns

• Suunto App & Watch

– Automatic re-routing from the Suunto app in activities, using the offline maps of the Suunto App (requires a Suunto App update in April)

– Offline routing in the Suunto App using GPX files

– Elevation model update when creating routes, more accurate ascent & descent

Machine Translated by Google

Q1-2026 Release Notes

Race S, Race, Race 2,Vertical 2

POINT 2

- **Maps 2.0 (Race S - Race 2- Vertical 2)**

– Maximum level of detail at zoom 500 m

– Names of towns

– Names of important places

– Peak names

– Altitude in contour lines

– POIs on the map
(bars, hospitals, water fountains, parking lots, etc.)

– Update on the new OSM paths

- **Swimming**

– Drills in swimming

– Manual lap button for intervals in the pool

- **Training and metrics**

– New HRR (Heart Rate Recovery) metric in training analysis

– FC Broadcast function, share FC

– Goal of advancement in activities

- **Improved Morning Report**

– Sunrise added to the report

Machine Translated by Google

Q1-2026 Release Notes

Race S, Race, Race 2,Vertical 2

POINT 3

• **Daily Smart Experience**

– Specific and independent alarms per day

– Independent vibration and sound adjustment for each alarm

– Independent adjustment of notifications and sounds for daily use

– Independent adjustment of mobile notifications and system notifications

– “MUTE” mode for daily use (silence sounds)

– Sunrise time added to the Morning Report

– “Go Around” numbers in stock selection

– Improvements to navigation menus

– Ability to configure system metrics in either metric or imperial units (distance in miles and degrees in Celsius)

– Instant altitude algorithm in the altitude widget

• **Experience in sport mode**

– Ability to enable touchscreen during activity

– Option to disable autolap notifications (at intervals created on the watch)

– New icon for the data field “% incline last 100 m”

– Independent adjustment of notifications and sounds for sports use

– The do not disturb and mute modes will not affect the sports modes; they will retain their custom settings.

Swim – Lap Button

Some users don't find the automatic interval very accurate due to their swimming style.

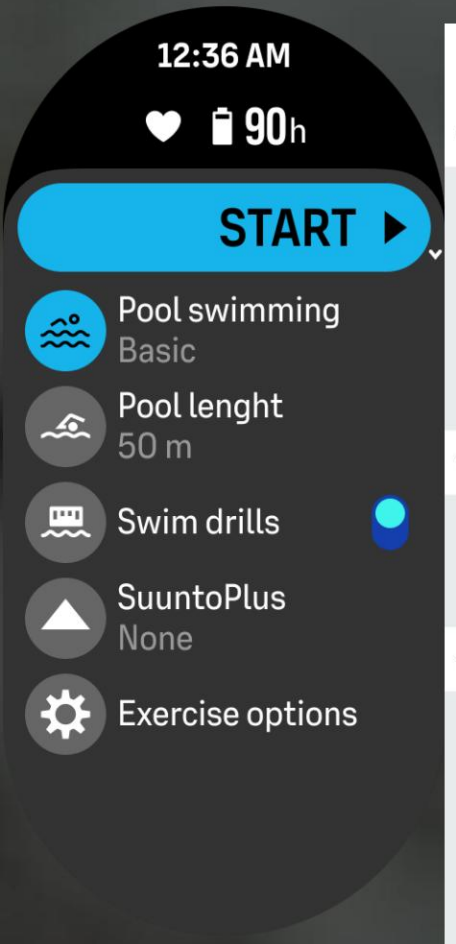

The manual lap button will synchronize with the intervals, so we will have exact precision with more accurate swimming speed adjusted to the lap button.

We can also work with the lap button. Manual and lap interval button: 2 in 1

Broadcast HR in activity

Suunto Vertical 2
Suunto Race 2
Suunto Race
Suunto Race S

WHY IN ACTIVITY AND NOT WIDGET?

– We can share heart rate data with exercise equipment such as treadmills, indoor bikes, rowing machines, etc., and have the activity displayed on the watch without needing to manually upload it afterwards.

– PRECISE HR: different HR algorithm for each sport, running, cycling, walking, weightlifting etc. This way we ensure a HR with maximum precision and not an HR with a standard algorithm for the day.

– We can share heart rate with a heart rate monitor belt connected to the watch, increasing connectivity

– Excessive battery drain “I forgot to disable heart rate sharing from the widget”

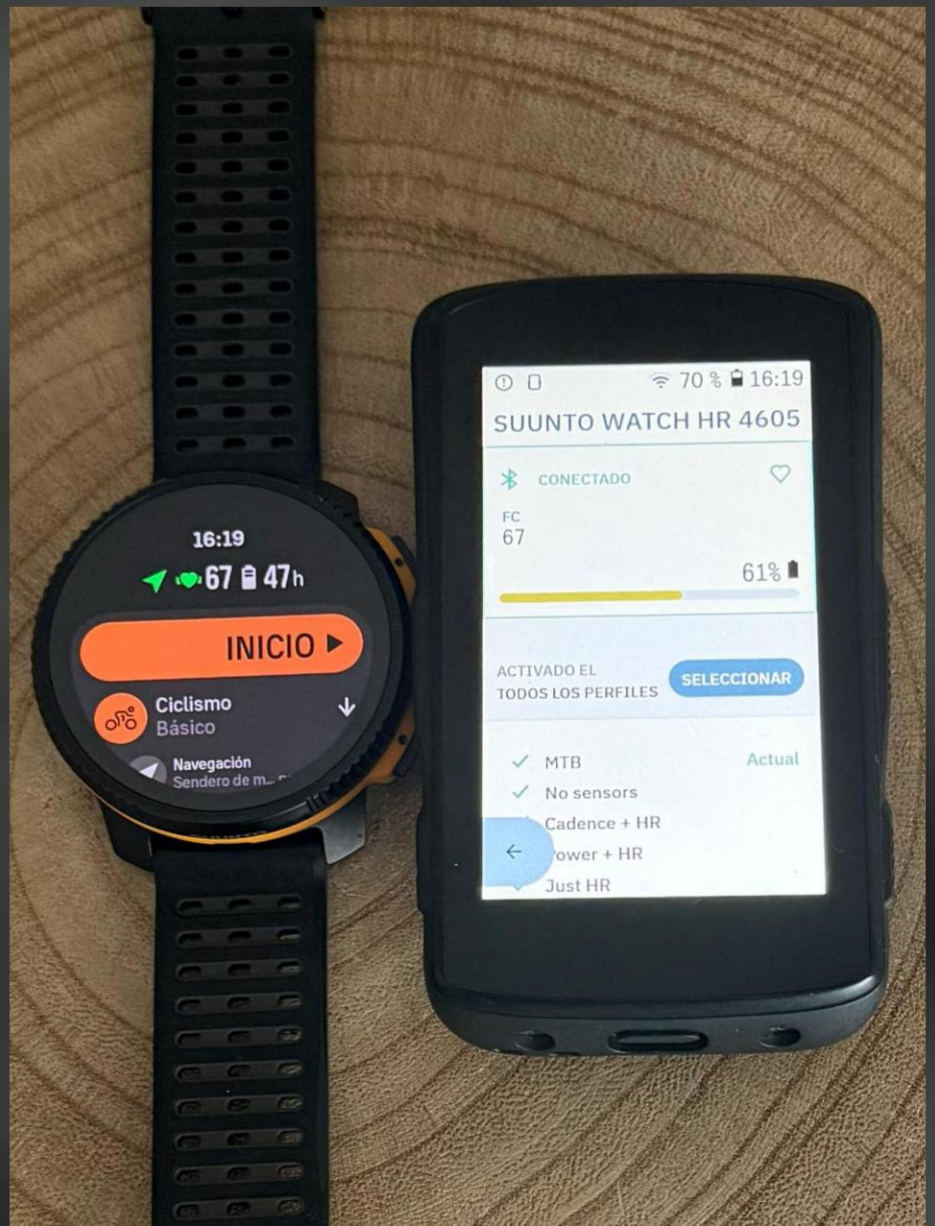

– Possibility of discarding the activity to avoid creating duplication, for example, after sharing with a cycle computer.

HR Recovery – During & After Activity

Suunto Vertical 2
Suunto Race 2
Suunto Race
Suunto Race S

Recovery heart rate is a key indicator of autonomic nervous system balance, especially parasympathetic reactivation, and can reflect fatigue, training load, and recovery status.

– Possibility of enabling it or not independently by activity.

– Once the activity is paused, a 60s measurement will begin and will give us information on how our recovery has been.

– The entire history is saved and taken into account in each recovery measurement, thus providing us with a much more accurate recovery data compared to previous activities.

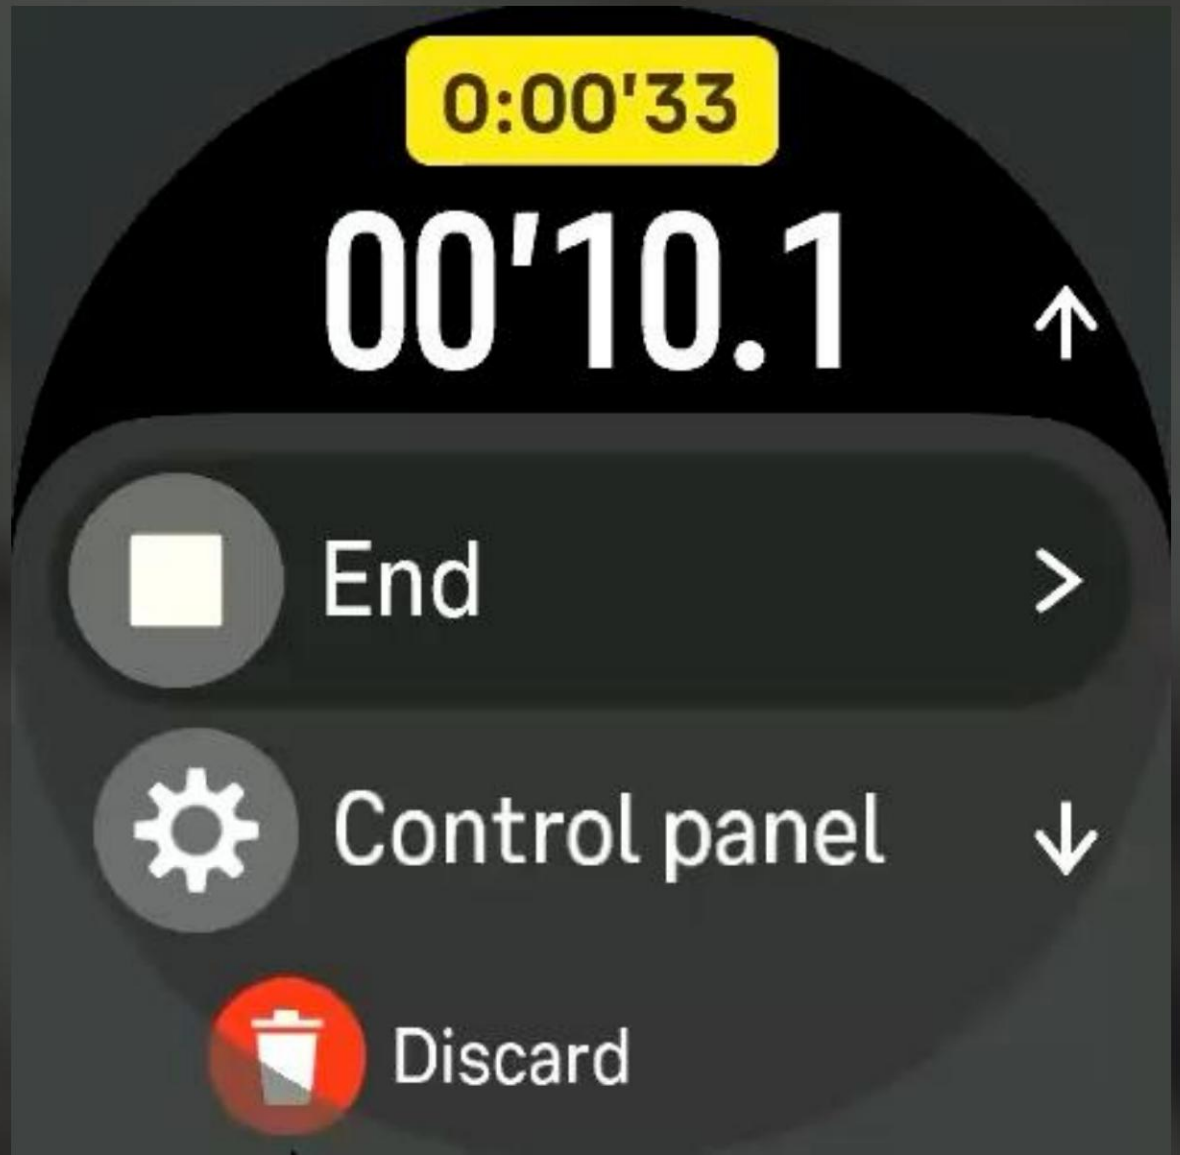

– In activity mode, we can configure a data field to see the response of our parasympathetic system, for example, during interval recovery, or on a trail run after a long climb.

Machine Translated by Google

SUUNTO

HR Recovery – During & After Activity

Suunto Vertical 2
Suunto Race 2
Suunto Race
Suunto Race S

Recovery HR is a key indicator of autonomic nervous system balance, especially parasympathetic reactivation, and can reflect fatigue, training load, and recovery status.

- The first 60 seconds after physical activity are key to assessing the behavior of the autonomic nervous system and, therefore, determining whether recovery has been good or poor. During these first 60 seconds, when the most significant change in heart rate occurs and clearly shows our recovery status.

–When pausing the activity, AS LONG AS WE ARE OUTSIDE ZONE 1, a 60s background measurement begins. When we finish the activity, the remaining time until the 60s HRR measurement will be displayed. If we pause the activity for more than 60s and stop it, we will directly see the result of the HRR measurement.

Machine Translated by Google

SUUNTO

HR Recovery – During & After Activity

Suunto Vertical 2
Suunto Race 2
Suunto Race
Suunto Race S

Recovery heart rate is a key indicator of autonomic nervous system balance, especially parasympathetic reactivation, and can reflect fatigue, training load, and recovery status.

– Measuring heart rate recovery time (HRR) during activity provides immediate feedback on how your heart rate recovers after intense exertion. Whether between intervals, during short breaks, or when changing pace on varied terrain, it allows you to assess actual fatigue and make smarter decisions about pace and training load.

“More information. Same clarity”

Suunto Vertical 2
Suunto Race 2
Suunto Race S

In this Q1 update we have enriched the maps with key information such as town names, relevant places, altitude in contour lines and new points of interest useful during outdoor activities, such as hospitals, pharmacies or water fountains.

In this first step, our goal has been to add information without cluttering the screen or compromising readability.

The priority remains to offer clear, intuitive, and reliable navigation in any environment.

SUUNTO

Smart Navigation

The new Suunto navigation completely changes the user experience.

It remains just as clean, intuitive and precise, but now adaptive navigation algorithms will make every turn fully customized to that moment in the route.

Visualize your turn or intersection well in advance, adapting to your speed, direction, and full view of the turn.

You no longer have to deviate 100 meters from your route to receive an off-route notification; now the new adaptive algorithm will alert you by adapting to your speed, direction, and distance.

Turn your breadcrumbs into a return route, thanks to Track Back.

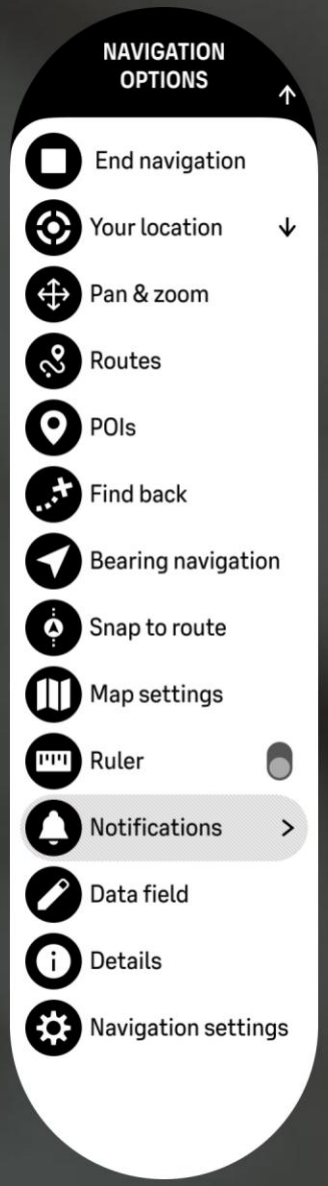

Always safe, with the Suunto app's offline maps and its re-routing to the watch in the middle of an activity.

Why don’t turn-by-turn directions appear when importing a GPX or third-party route?

Machine Translated by Google

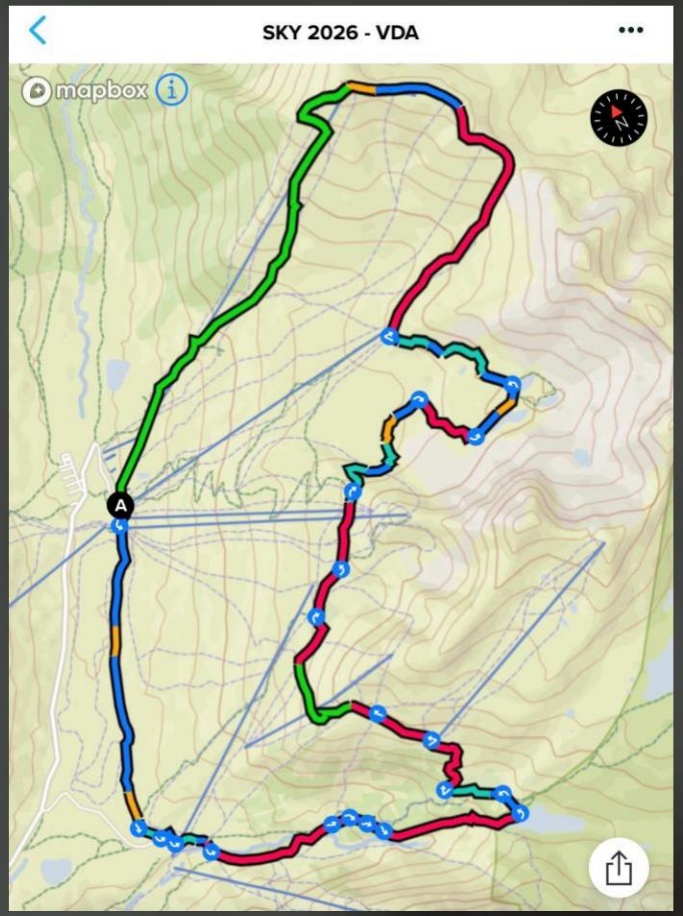

SUUNTO

Automatic turns according to the degree of the curve

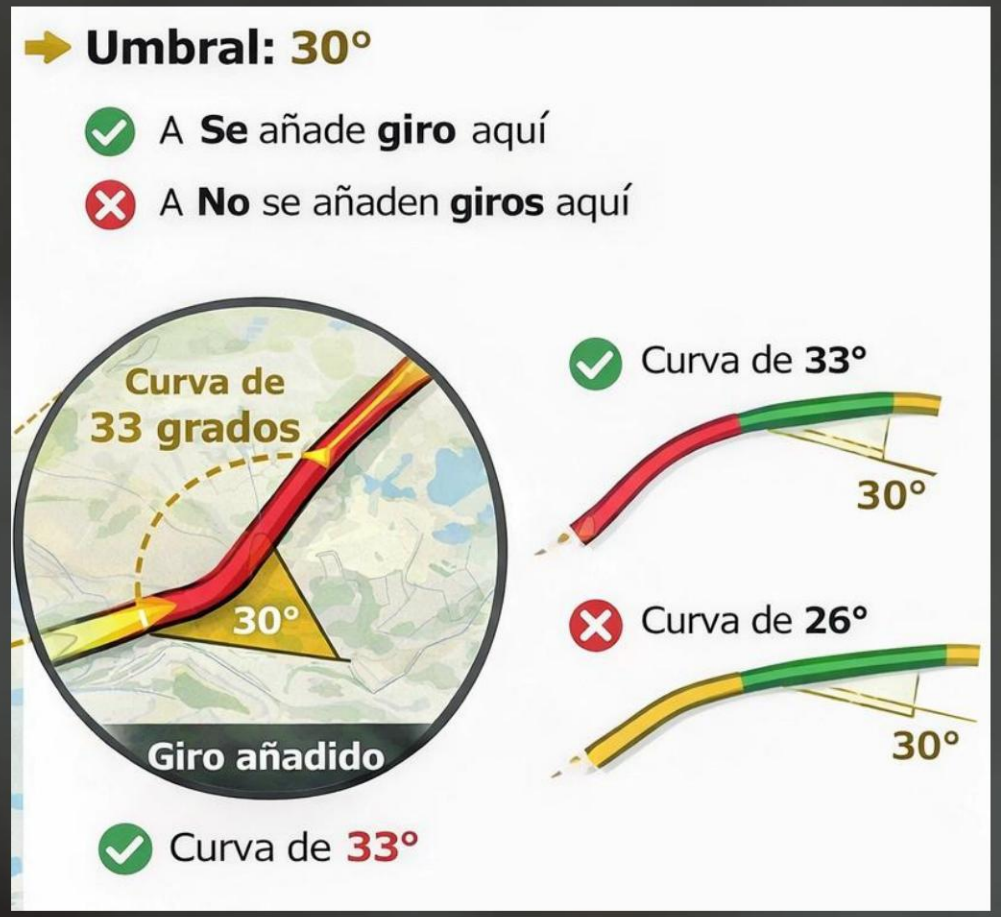

Some platforms automatically generate turns when a curve exceeds a threshold angle (for example, 30°), which may cause the omission of relevant turns or incorrect alerts

Platform with GPX
8 Turns

Suunto App – Manual
22 Turns

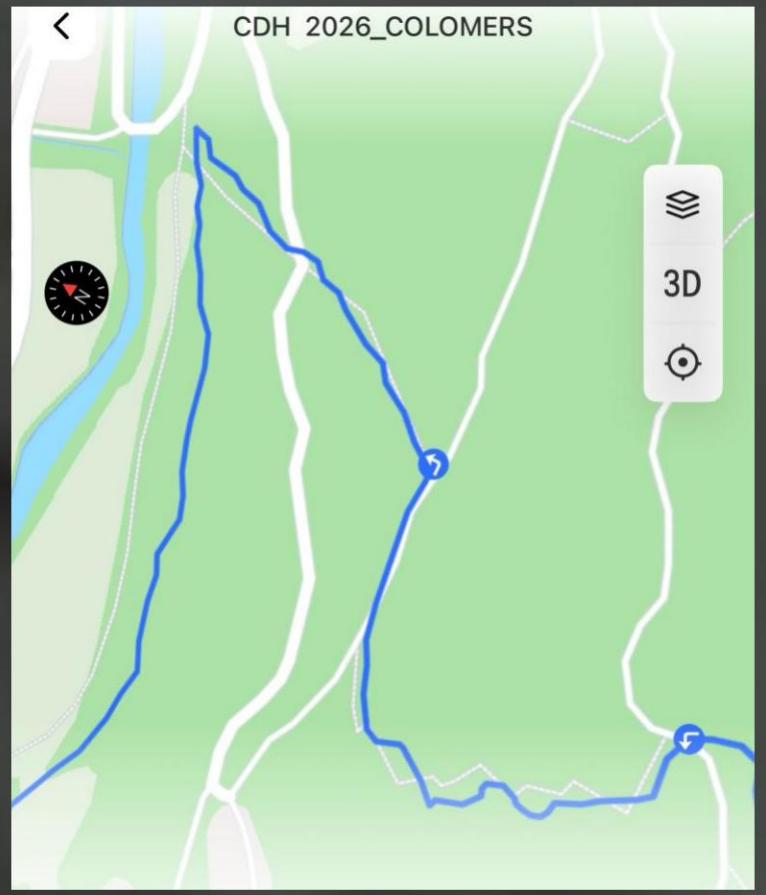

Example rotation X angle
30º

Machine Translated by Google

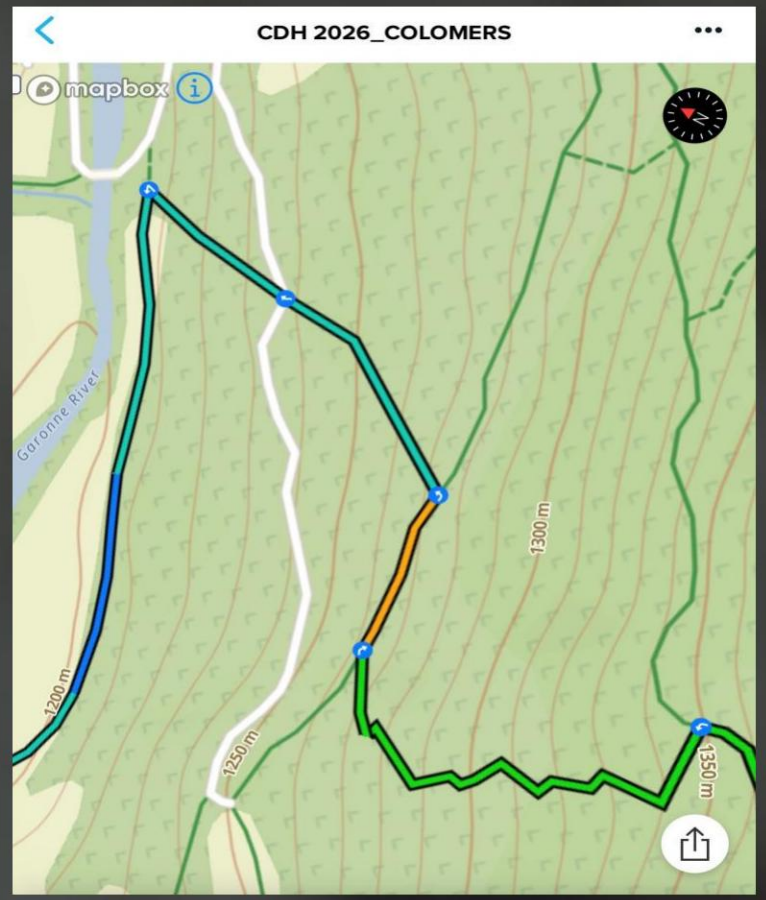

SUUNTO

Automatic turns according to the degree of the curve

If we extrapolate this behavior to a marathon or an ultra distance, navigation can become extremely imprecise, omitting real route decisions.

Platform with GPX
8 Turns

Suunto App – Manual
22 Turns

Ways to generate turns

1. Watch-specific mapping; the watch generates turns (Garmin only) depending on the watch's map update frequency

2. The watch interprets the graduation of curves as turns.

3. Importing GPX files, they generate turns by graduation of curves

4. Manually creating a route in the platform creates safe turns with fully updated map information.

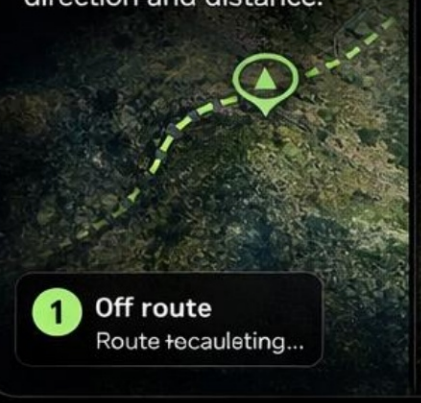

5. Third-party platforms with their own twists and turns, such as Komoot and some Wikiloc routes
